

INNOVATIVE COMPONENT IN THE EDUCATIONAL PROCESS

DOTSENKO Y.V., SYDOROVA N.V.

Odesa State Academy of Civil Engineering and Architecture, Odesa, Ukraine

Education has always been and remains proportional to a specific stage of development of society. In society, it is the most massive type of human activity. And today there is another stage of searching for its evolutionary forms due to the outflow of youth abroad and the reduced number of youth in general. Given the globalization of the problem, the question arises, how to stop this process? How to preserve quality education in Ukraine?

Education must have the ability to advance, meeting the interests of an evolving society, a specific individual and a potential employer. Assessment of the adequacy of this issue assumes the dynamism of the educational process and its technologicality. That is why it is necessary to focus on socially oriented innovative technologies for the modernization of society by means of education. Innovative technologies in higher education institutions, that is, technologies based on innovations, are, first of all, a condition for increasing not so much the quantity of education as its quality, and, therefore, an opportunity to increase the competitiveness of a particular higher education institution in the market of educational services.

The educational process, regardless of its form and type, is always aimed at providing high-quality educational services. And despite the realities of today, today it is possible to identify the following conditions that allow ensuring the quality of education in higher education, namely: a high professional level of the teaching staff; a rational combination in the educational process of established classical teaching methods with active methods of student learning; scientific research in universities, based on the idea that there is no teacher without science; the presence of an autonomous structure of the academy, which directly manages the quality of education.

The quality of education is a national problem of our time. Education is a social right of a citizen, the sum of knowledge, cultural skills, professional orientations necessary for the life of a citizen in the modern socio-economic space and society as a whole. We are trying to preserve this right for our children during the war. And the main thing is that we cannot wait for better times to improve the quality of education. Therefore, Ukrainian educators continue to introduce innovations, despite the mixed form of education and the fact that martial law is in effect in the country, using innovative methods and techniques. In any difficult conditions, teachers continue to radiate optimism and charge students with it. They themselves are invincible and raise the same generation - invincible, free people.
